pictures!

SUPER SMELLERS & INCREDIBLE CLAWS

What big noses! Grizzly bears have long noses to heighten their sense of smell. The inside of a grizzly's long muzzle is filled with nasal folds called mucosa that increase the amount of surface area for scents to adhere. Because of these folds grizzly bears can smell 2100 times better than humans!

Grizzly bears have some of the longest claws in the animal kingdom! But surprisingly, they are not primarily for hunting or catching food. Grizzlies primarily use these claws for digging and ripping open logs to find insects, nuts, and roots!
