ZEBRAS

HYPNOTIC STRIPES

Zebras have built-in bug repellent! New studies show that biting flies and mosquitos are confused by zebras' stripe pattern, and don't know where to land. This prevents zebras from getting as many insect bites as other animals. This technique is so successful that some horse and cattle ranchers have started giving their animals zebra blankets to try to trick the flies like zebras do!

Find the FIVE hidden items in the zebra's stripes!
